

9.0 I/O Reflection

Fallingwater really challenges the idea that architecture and nature have to operate separately. It questions the assumption that buildings must have a negative impact on the natural landscape.

Modernist architecture often aimed to control nature. It treated the environment as something to control or even ignore. In contrast, Frank Lloyd Wright attempts to blend architecture into existing environmental systems.

This relationship can be understood more clearly:

First Nature: the natural landscape, including rock, water, and vegetation

Second Nature: the constructed building, shaped by human intention

Third Nature: the digital systems that now influence how space is experienced and understood

FRANK LLOYD WRIGHT

SHE'LL CARRY ON THROUGH IT ALL

AN IDEA IS SALVATION BY IMAGINATION

Fallingwater exists between the first two conditions. It attempts to reconnect human experience with the natural environment through physical design.

The introduction of Third Nature gives rise to the question of whether technology can support any reconnection with nature, or whether it just accelerates more disconnection.

Wright's work suggests a possible model. One where architecture and artists act as a bridge between human experience and the natural world. Not by exploiting the environment, but by aligning with it.

The important question is whether we are too late to resolve the issues within a society that is increasingly shaped by digital systems.

Are digital distractions
keeping us from the
physical world?

ARCHITECTURE IS THE ART
OF HOW TO WASTE SPACE.

WRIGHT

10.0 Final Reflection

The work of Frank Lloyd Wright did not become fully shaped quickly. It developed over time through experimentation, influence, and most of all failure.

I've learnt that he built projects based on the elements that were successful on the last project he did. Ideas are tested, adjusted, and improved.

This supports a key idea within my I/O project. The process is more important than the final outcome, especially for a student.

Complete understanding does not appear instantly. It develops gradually through trial and error. Through the process of making, testing, and reflecting on decisions, an unclear idea becomes more defined over time.

Creative work is an ongoing occupation. It is not a sequence of unrelated isolated projects and tasks, but a continuous line of development. Each stage informs the next activity. Unsuccessful ideas remain important, as they redirect the process.

ATERFALL

For my own work, I/O1 to I/O2 reflects this development. The movement from an outward, speculative focus to an inward, grounded investigation was not planned from the start. It emerged through reflection and reassessment. I had an idea to develop but it took time to be refined and focused.

Fallingwater becomes important not only as a final piece of architecture, but as part of a wider process. It represents a moment within an ongoing development, rather than a fixed conclusion.

This changes how I understand my own work. The focus is no longer on producing a single resolved outcome, but on developing a sustained investigation.

The project becomes less about finding a final answer, and more about asking better questions over time.

I've realised that in a world where the generation of creative output can be replicated easily by artificial intelligence, it is more important and valuable to ask questions about the process and reason for making art. If Computer Science is focused on technology replicating human creative output from the past I believe it is the role of artists to "break" these systems down to discover not just how efficiently it can reproduce art, but more critically how it can be shaped and guided to produce art that we have never experienced before. This could be equally important as to how we can rediscover art history in a more interesting and accessible way than is on offer today. I've learnt about exhibitions like the Da Vinci digital experience as a way that will inform future generations of progressive artistic practices that were as radical in their day as contemporary artists working with digital media today.
